esytouch is an optional, programmable USB keypad that reproduces a single shortcut, saved macro or a keystroke sequence by the press of one key only.

esytouch is delivered with software which assists the user to program any of the software or PC keys or controls as well as to store the launch sequence of a script. A large variety of customized key-mappings for different applications can be created to simplify and enhance work on the PC.

esytouch connects through the USB port to the PC. The internal micro SD-card can be used to store the personalized key-mapping or used as an additional memory.

esytouch is a device that can be used by persons with different disabilities. It is suitable for persons with learning disabilities, visual impairments and sensory difficulties or a combination.
